

A Sample of 10 boxes of raisins has weight their weights (in gms)

25, 28, 29, 30, 34, 35, 35, 37, 38

Step 1 $\rightarrow$ order the data from smallest to largest
Data Already in order

Step 2: $\rightarrow$ Find Median
25, 28, 29, 30, 34, 35, 35, 37, 38

$$\frac{30 + 34}{2} = 32$$

Step 3: - Find the Median & quartiles (the first quartile is the median of data points to left of the median)

25 28 29 29 30

$$Q_1 = 29$$

The third quartile is the median of data points to right of the median

34 35 35 37 38

$$Q_3 = 35$$

Step 4: - complete the five number summary by finding the min and the max

The min is smallest data point which is 25

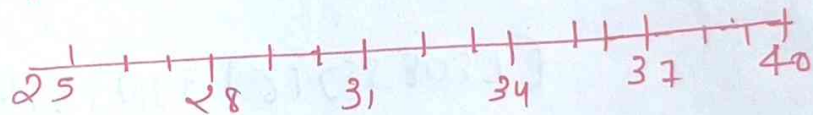

The max is the largest data point which is 38

The five - number summary is

25, 29, 32, 35, 38

making a box plot

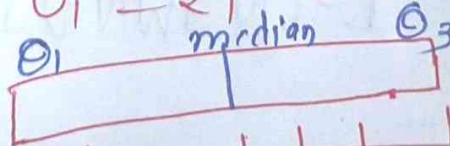

Step 1: Scale and label an axis that fits the 5 number summary

Step 2: →

Draw a box from Q_1 to Q_3 with vertical line through the median

Recall the $Q_1 = 29$ median 32 $Q_3 = 35$

Step 3: → Draw a whisker from Q_1 to min and from Q_3 to max
min = 25 max = 38
